# CDF Checklist of Galapagos Lichenized Fungi

Frank Bungartz, Frauke Ziemmeck, Alba Yáñez Ayabaca, Fredy Nugra, André Aptroot

**Last updated:** 03 Dec 2013

## Abstract

This Checklist of Galapagos Lichenized Fungi includes a total of all 797 taxa reported from the Galapagos Islands.

For each name, detailed information is provided: its Galapagos distribution in islands groups or bioregions generated from the specimen records, comments about the taxonomy (especially synonyms), the origin (native and introduced), taxon status (accepted vs. rejected records) and relevant literature references.

## Introduction

This publication lists all species of Galapagos Lichenized Fungi currently known.

This checklist includes all lichen fungi that are currently known to occur in the Galapagos Islands. This list also includes some fungi typically associated with lichens (lichenicolous fungi, i.e., fungi parasitic or parasymbiotic on lichens) or often treated by lichenologists even though they are not lichenized.

Lichens do not represent a taxonomic group, but are a classic example of a symbiosis, i.e., two very different organisms living together to form a new entity.

The outside shape and structure that we notice as a lichen is built by a fungus. Inside, this macroscopic structure hosts microscopic cells of green algae (Chlorophyta) or blue-green photosynthetic bacteria (Cyanobacteria).

The fungi that participate in this symbiosis belong to two taxonomic divisions (or phyla): Basidiomycota & Ascomycota.

## Methods

This checklist of all known Galapagos Lichenized Fungi is automatically generated using the online database of the Charles Darwin Foundation Galapagos Species Checklist.

All CDF Galapagos Species Checklists represent the synthesis of many different records: literature citations, data from previously unpublished reports (grey literature), specimen records of natural history collections located in Galapagos and all over the world. To the best of their knowledge authors of the individual checklists revised all available data. When new information becomes available, the taxonomy of a group changes or new species are discovered, the CDF online database and thus this publication becomes updated.

For many poorly known species groups the higher taxonomic classification still regularly changes according to how our knowledge about species being related changes. In many well known groups the phylogeny is somewhat stable, but to avoid confusion, in particular for groups where taxonomic changes are frequent, all checklists presented here are sorted alphabetical according to genus name and specific epithet. Please refer to the website for the currently accepted taxonomic hierarchy of each group.

Please be aware that the distribution presented here is automatically generated from specimen records and does not always accurately reflect the known distribution for all species.

For marine species, the distribution generally refers to the five main bioregions of the archipelago (Far Northern, Northern, Western, South Eastern and the Elisabeth Bay Bioregion). For the terrestrial species more than 120 islands, islets and small rocks have been aggregated into Islands Groups, thus, for example, the island group "Santa Cruz" includes smaller islands like Santa Fé, Plaza Norte, Plaza Sur, Baltra, Daphne Mayor, Daphne Minor, and others.

IUCN red-list assessments presented here may deviate from the global IUCN list for the following reasons:

- for well known species groups like vascular plants or vertebrates updates proposed to the IUCN are shown instead of the outdated, but currently accepted status;
- for poorly known species groups (e.g., lichenized fungi) a general assessment is currently not possible and the list presented here is a regional red-list list for Galapagos archipelago.

Numbers of the species included in this list are auto-generated. Adding up the number of species in each category will not always equal the total number indicated. Some species have insufficient data to be categorized while others (e.g., category eradicated) will not be included in the total.

166. *Cyphelostereum sp. 1*

**Taxon status:** Unpublished name (Nomen nudum).

F. Bungartz: Dictyonema phyllogenum f. defectum was described for a morphotype with a very poorly developed fungal sheath (Lücking 2008). Fig 258 E-F in Lücking (2008), however, depicts cyanobacterial trichomes that are not closely bundled as it is the case in the Galapagos material. Also, trichomes of Dictyonema phyllogenum f. defectum are appressed rather than erect, as seen in the Galapagos material. The Galapagos specimens grow on a variety of substrates, one also found on leaves of the endemic Miconia robertsoniana, but most were collected on bryophytes. The micromorphology of these specimens is quite

similar, but not identical with free-living forms of *Scytonema*, since *Cyphellostereum* sp. 1 clearly presents fungal sheath cells surrounding the cyanobacteria.

31. *Cladonia rappii* A. Evans  
F. Bungartz: only one minute, fragmentary specimen in CDS (Aptroot 65573 B); originally identified by A. Aptroot as *C. rappii*, annotated by T. Ahti as *C. sp.* (probably undescribed, *C. aff. rappii*); however, the fragmentary minute material is extremely similar to basal squamules of *C. pulverulenta*, which also contains fumarprotocetraric acid, no typical material of *C. rappii* has been reported from Galapagos

32. *Cladonia subulata* (L.) Weber ex F.H. Wigg.

Misidentification of *Cladonia didyma*, fide F. Bungartz annotation, 2006

34. *Coccotrema colobinum* (Tuck.) Messuti

F. Bungartz: The type specimen of *Pertusaria colobina* Tuck., later transferred by Messuti & Vobis (2002) and Messuti (2003) into *Coccotrema colobinum*, was supposedly collected by the Reverend T. Hill during the Hassler Expedition in Galapagos. Messuti & Vobis (2002) suggest that one of four specimens labelled (a) in the packet is material collected in Galapagos. It is, however, highly doubtful that any one of these four specimens was actually collected in the archipelago. Not a single specimen of that species has ever been found since. Instead, Messuti & Vobis (2002) cite two more specimens collected by Imshaugh & Ohlsson (MSC 43340, MSC 44816) from the Chilean cost. It is therefore much more probable that the type material of this species, like so many other specimens collected by Reverend T. Hill during the Hassler Expedition, was actually mislabeled (previously the same was already suggested by Weber (1086) p. 490); A. Fryday examined the type from FH and obverved: "The "Galapagos" collection has *C. coccophorum* (= *Lepolichen coccophorus*) on the same piece of bark, which makes the possibility that it is really from the Galapagos extremely unlikely. It was even annotated "probably from Str. of Magellan" by Rolf Santesson in 1955.".

64. *Lecanora glaucovirens* Tuck.

Type: Hassler Expedition (FH), coll. Rev. T. Hill; Weber (1986: 489) doubts that this specimen was actually collected in Galapagos; F. Bungartz: the type specimen (FH-TUCK 197145) does not belong to *Lecanora* but to *Lecidea* s.l. and no similar material was ever collected again in the Galapagos.

65. *Lecanora helva* Stizenb.

Misidentifications based on a confusion with the very similar *L. leprosa*, fide Bungartz annotations 2008; Guderley (1999) erroneously states that *L. helva* grows in association with the endemic *L. schindleri*, but all specimens he annotated are identified as *L. leprosa*, not *L. helva*.

66. *Lecanora orosthea* (Ach.) Ach.

F. Bungartz: misidentifications of sterile *L. substrobilina*

Acc. name: *Opegrapha cactacearum* s.str. fide D. Ertz 2010
80. *Parmeliella mariana* (Fr.) P.M. Jørg. & D.J. Galloway  
F. Bungartz: First reported by Weber (1986 p. 474) as *Parmeliella pannosa*. Index Fungorum suggests that *P. pannosa* is a synonym of *P. mariana* based on the Australian checklist. This is erroneous, both taxa are good species, *P. pannosa*, even if does not exist in Australia. Elix & McCarthy (1998 p. 171-172) recognize both *P. pannosa* and *P. mariana*, but suggest that the Galapagos record refers to *Parmeliella mariana*. The specimen that Weber collected and upon which the record is based, is, however, densely isidiate and thus refers to *Parmeliella stylophora* (Vain.) P.M. Jørg.
81. *Parmeliella pannosa* (Sw.) Müll. Arg.

90. *Physcia aipolia* (A. Massal.) Zahlbr.

F. Bungartz: In Weber (1986) and Elix & McCarthy (1998) as *Physcia mexicana*, but this taxon is not included in Moberg (1990) The lichen genus *Physcia* in Central and South America. The Galapagos material has a medulla K+ yellow and therefore does not belong to *P. biziana* as which it previously has been misidentified. Intermittently the specimens were thus referred to *P. aipolia*. However, unlike *P. aipolia*, Galapagos specimens are much finer lobed and do not contain zeorin despite their K+ yellow medulla. The material is thus chemically distinct from *P. aipolia* s.str. and is therefore now treated as *P. aipolia*, unless studies future of the type suggest otherwise.

91. *Physcia biziana* (A. Massal.) Zahlbr.

Acc. Name: *Physcia aipolia*, in Weber (1986) and Elix & McCarthy (1998) as *Physcia mexicana*, fide A. Aptroot (pers. comm.); Galapagos material medulla K+ yellow!!!, F. Bungartz

92. *Physcia convexella* Moberg

F. Bungartz: *P. convexella* was originally published based on a specimen from Cuzco, Peru at 2800 m altitude and it is very unlikely that Galapagos specimens that occur in the dry and coastal zone belong to this species.

The only CDS specimen identified by Moberg (UPS) as *P. convexella* (Aptroot 64468) has a K+ yellow medulla and thus does not agree with the description in Moberg (1990), which states that *P. convexella* is K-. The specimen is treated here as *P. mexicana*.

93. *Physcia lacinulata* Müll. Arg.

All specimens have a black lower side and thus belong to *P. lobulata*, fide F. Bungartz

94. *Placopsis cribellans* (Nyl.) Räsänen

98. *Porina subinterstes* (Nyl.) Müll. Arg.

F. Bungartz & R. Miranda: The specimen (Bungartz 8758) originally annotated by R. Miranda as *P. subinterstes* has wart-shaped to hemispherical perithecia and thus belongs to *P. melanops*.

99. *Porina tetracerae* (Ach.) Müll. Arg.

In Elix & McCarthy (1998) erroneously cited from Galapagos (Weber 1993: 433), but the citation in Weber (1993) is from the Cocos Islands! Reports of the species in previous versions of this checklist were cited as "rejected"; one single specimen in CDS (Aptroot 64623) annotated by R. Lücking as *P. tetracerae* is extremely poorly developed and lacks perithecia; the specimen is treated here as *P. distans* (= *P. cf. conspersa*).

Syn.: *Lecanora atra*, fide Elix & McCarthy (1998); F. Bungartz & K. Kalb: all records previously identified as this species are misidentifications of *Tephromela rizophorae*

125. *Trapelia placodiooides* Coppins & P. James

F. Bungartz: specimens contain xanthones and are possibly an undescribed Pertusaria

126. *Trypethelium refertum* Stirn.

F. Bungartz: misidentification of *Anisomeridium tamarindi*

127. *Trypethelium tuberculatum* (Vain.) R.C. Harris

Misidentifications of *T. aff. marcidum* fide annotations F. Bungartz & R. Miranda, 2011

128. *Usnea amabilis* Motyka

Misidentification; Weber (1986: 493) states that *U. longissima* reported by Stewart (1912) is *U. amabilis*, both IDs are misidentifications of *Usnea mexicana*, fide P. Clerc, M. de los Angeles, C. Truong annotations, 2008

129. *Usnea antillarum* (Vain.) Zahlbr.

Misidentification of various different *Usnea* spp., fide Clerc, P. annotations 2008

130. *Usnea arthroclada* Féé

Probably misidentification of *Usnea mexicana*, fide F. Bungartz

131. *Usnea ceratina* Ach.

Misidentification of *Usnea rubicunda*, fide Elix & McCarthy (1998)

132. *Usnea cladocarpa* Féé

Misidentification of *Usnea* spp., fide P. Clerc, M. de los Angeles & C. Truong annotations, 2008

133. *Usnea dasypoga* (Ach.) Röhl.

Misidentification of *Usnea cf. bornmuelleri* and *U. baileyi*, fide P. Clerc & C. Truong annotations, 2008

134. *Usnea longissima* Ach.

Misidentification for *U. mexicana*, fide P. Clerc, C. Truong & M. de los Angeles Herrera Campos (pers. comm, 2008)

135. *Usnea mirabilis* Motyka

Probably misidentifications of *Usnea rubicunda* fide C. Truong

136. *Usnea paradoxa* (Zahlbr.) Motyka

Misidentification of *Usnea angulata*, fide P. Clerc & C. Truong annotations, 2008 & F. Bungartz, 2009 (FH 197301)

137. *Usnea plicata* (L.) Weber ex F.H. Wigg.

Syn.: *Usnea dasypoga* var. *plicata*; According to Weber (1986: 493) "reported on the basis of scrappy specimens collected by J.H. Andersson and Charles Darwin" which do not resemble *U. plicata*.

138. *Usnea rubiginea* (Michaux) A. Massal.

C. Truong: Galapagos specimens under the name *U. rubiginea* (Weber 1987) belonged to *U. erinacea*, *U. rubicunda* or *U. poliotrix*; this taxon cited by Weber is listed in Elix & McCarthy (1998) as *Usnea rubicunda*.

139. *Verrucaria cf. pinguicula* A. Massal.

F. Bungartz: records based on misidentifications; all specimens identified by Breuss as *Verrucaria* sp. According to Orange et al. (2009, in Smith et al. Lichens of Great Britain and Ireland p. 954) *Verrucaria pinguicula* grows on hard limestone, a substrate absent from Galapagos.

140. *Verrucaria inficiens* Breuss

F. Bungartz: material initially identified by O. Breuss, later revised to *V. lecideoides*

141. *Verrucaria polysticta* Borrer

F. Bungartz: According to Breuss all with hymenial algae and thus referred to *Staurothele* sp.

142. *Xanthoparmelia microspora* (Müll. Arg.) Hale

F. Bungartz & A. Spielmann: Nash, Gries & Elix (1995) cite a specimen of *Xanthoparmelia microspora* (COLO Weber L-62892) that was originally, in 1976, also identified by Hale as *X. microspora*. However, Hale in 1980 revised his identification to *Pseudoparmelia leucoxantha*, which was recombined into *Flavoparmelia leucoxantha*. The specimen does contain protocetraric acid, not salazinic acid and thus does not belong to *X. microspora*!

143. *Xanthoria candelaria* (L.) Th. Fr.

Misidentification of *Xanthomendoza weberi*, fide F. Bungartz annotations, 2006

144. *Xanthoria cf. tenuiloba* L. Lindblom

Misidentification of *Xanthomendoza weberi*, fide F. Bungartz annotations, 2006
